

Janet searches online to create a list of all movies coming out this month.

Janet inserts the movie poster, description, and parental guidance rating of the new movie.

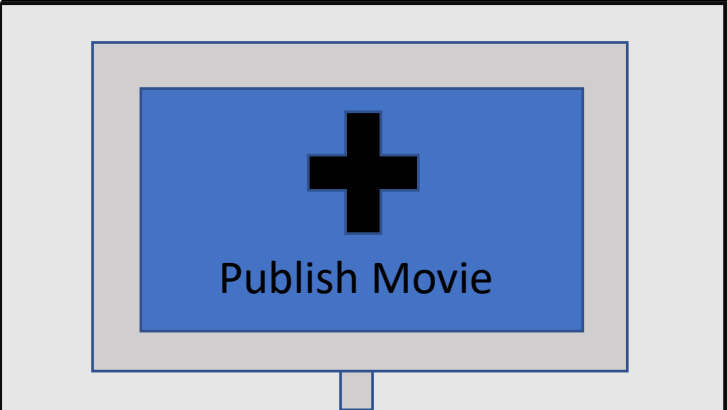

Janet searches for the movie poster, description, and parental guidance rating of each upcoming movie.

Janet checks to make sure there are no errors in her work.

Janet creates a new movie instance on the website/app.

Janet publishes the new movie instance, allowing users to interact with it.

Tom just got finished with his final class of the day. It was a very tough class and as a result he is very worn out for the day. He is ready to go back to his dorm.

After a long walk back he's finally home. Ready to relax for the rest of the day

Tom wants to watch a movie in his free time. However, he doesn't have any ideas of what to watch on his mind. Fortunately, he installed an app that gives his recommendations on movies and shows based on the ones he already likes.

His highest rated recommendation is a movie called *The Dark Knight*. He's heard good things about the movie, but he's never watched it himself. He figures, he might as well give it a try.

Tom makes popcorn and turns on the movie. Time to see what the hypes all about and whether or not the app works.

The movie concludes and well, its safe to say Tom will be using the app much more often from now on.

PERSONA: Joshua Smith  
App Admin

Joshua logs onto the app to see some user suggestions!

USER STORY/SCENARIO: Implementing User Suggestions

He evaluates each suggestion & moves them to a separate spreadsheet

Joshua brings the user suggestions to his boss

Joshua receives the approved suggestions from his boss

Joshua gives a copy of the changes to the programmers

Finally, Joshua writes a notice to the userbase of the upcoming changes
